

Emergency Inbox.

Automatic access to email if your server fails or unexpected downtime hits, keeping your business fully operational.

What happens when you cannot get your email?

When some part of your network fails such as a server or your broadband connection, the first and perhaps most significant impact to any business is normally your email. A few minutes without email may be manageable but what about a few hours or a few days?

With Maildistiller you can obtain full access to your emails from the moment of a server failure with **the ability to read, forward, reply, compose new and open attachments... What downtime?**

With Maildistiller you can have your very own Emergency Inbox for these exact circumstances.

Maildistiller guarantees that if a message cannot be delivered due to network issues, you can access it instantly and securely via any web connection.

Access your queuing email via a web mail client with the ability to read, forward, reply, open attachments and as a result keep your business running.

Whilst other Email Continuity systems only activate when an action is taken after a disaster, **Maildistiller's Emergency Inbox is always on and always available**, kicking in from the very moment a problem hits so you won't miss a single email. The functionality of our emergency is designed to be automatically compliant to the users needs.

When email is unable to reach its destination server, Maildistiller's Emergency Inbox makes the email instantly available via a webmail client. No fuss, or no urgent calls required.

The service enables inbound and outbound email to be available from secure data centres to end users. The webmail client allows users to send and receive email from any browser from any internet connection worldwide, ensuring that important communication is not lost during an email server outage situation.

With access to off-site webmail, end users may also use this to respond to the email as they would normally, allowing business to continue unheeded via email.

With no additional hardware, no software and no change to email address required, it's business as usual with Maildistiller.

With Maildistiller you can be sure to always receive your email... Panic averted!
