

# Maildistiller Vs. Spam and Viruses

**Spam is not just someone trying to sell their wares, a considerable number of these emails include some form of malware, be it a virus, spyware, rootkits or phishing. Although it is imagined that well educated business users would never dream of opening or responding to one of these messages, unfortunately it does happen regularly and with the increased sophistication of these emails the number of victims taken in is unsurprisingly increasing rapidly.**

Maildistiller has designed a unique solution combining up to 8 parallel processing virus engines to filter email from threats or unwanted content, constantly updated with new information and operating at the highest possible levels of accuracy, performance and effectiveness. Maildistiller offers a combination of world-class technology, round the clock support and cost effectiveness and security.

## So how is my email protected?

Multiple virus engines scan each email that is processed. Using more than one engine ensures that all known viruses are captured. Your mail is scanned with a unique spam solution that checks the characteristics of the message. This solution carries the highest detection rate (98%) while minimising false positive messages.

**We can detect spam when sent as images, embedded links or text and as we use a bulk mail method of detecting spam, we're not constrained by the limitations of Bayesian or Lexical Analysis that spammers are now routinely exploiting.**

Spam free messages are then scanned by up to 8 independent virus engines ensuring that only virus and spam free mail is received.

Heuristic scanning also scans each email to look for unknown viruses. **Heuristics looks for viruses within an email that are currently unknown. This process guarantees 100% protection against viruses.**

## Why Maildistiller?

By filtering your mail at the internet level before it reaches your network, your company can save considerable amounts on administrative tasks, bandwidth, end-user filtering and even disk space on your servers. Implementing Maildistiller offers you the reassurance of knowing you taken all the precautions required to protect your company and employees in their online activity.

So when the Media reports yet another global virus outbreak, you can be confident that Maildistiller has your organisation already protected.

## What Makes Maildistiller so effective?

- **Proactive monitoring, centrally updated every second, free from client involvement**
- **Language independent**
- **Lowest tolerance for false positives in the industry**
- **Multi Engine Virus protection in conjunction with the best threat detection centres in the world**
- **Detects Spam in images – checks for more than just text**
- **Quickly identifies and protects against fraudulent email such as Spoofing or Phishing, blocking Spam Viruses and Worms from entering or leaving your organisation**
- **Updating in real time to protect you from breaking threats with a web administration console for you to monitor performance**
- **No costly hardware or software deployed in your organisation**
- **Detecting and preventing Spam and Worms from entering your organisation in as little as 90 seconds of actual creation somewhere in the world**
- **One size fits all – our solution is designed to accommodate organisations with as little as 5 mailboxes, to as many as 5 million mailboxes**
